

## Initial value problems (IVPs)

### Linear Equations (IVPs)

#### Example 5

Solve  $\frac{dy}{dx} + y = x$ ,  $y(0) = 4$ .

**SOLUTION** The equation is in standard form, and  $P(x) = 1$  and  $f(x) = x$  are continuous on  $(-\infty, \infty)$ . The integrating factor is  $e^{\int dx} = e^x$ , so integrating

$$\frac{d}{dx} [e^x y] = x e^x$$

gives  $e^x y = x e^x - e^x + c$ . Solving this last equation for  $y$  yields the general solution  $y = x - 1 + ce^{-x}$ . But from the initial condition we know that  $y = 4$  when  $x = 0$ . Substituting these values into the general solution implies that  $c = 5$ . Hence the solution of the problem is

$$y = x - 1 + 5e^{-x}, \quad -\infty < x < \infty.$$
